## THE MICROTEC WATERLESS URINAL UNIT

A pictorial view of the Microtec unit and how it fits into a standard urinal.

Each unit has its own biocide block incorporated within the inner cartridge casing which sanitises the urinal each time it is used.

The top anti-splash casing allows urine to pass through into the inner chamber where it is treated and neutralized. The neutralized liquid then settles into the trap waste where it acts as a barrier against bad odours returning back into the wash room via the urinal.

Each subsequent use of the urinal replenishes the treated urine and flushes out the reservoir with fresh neutralized liquid.

All the Microtec cartridges are 100% biodegradable and can be dispensed into landfill sites quite safely. The product has an improved biodegradability rate which means it spends less time in landfill, helping to reduce greenhouse gasses.
